

AccessBridge
PLAYABLE BY EAR

Serato DJ Pro & djay Pro, **playable by ear.**

A macOS app that lets a blind DJ run the two industry-standard programs entirely by ear — no sighted help, zero setup. Working software today, in testers' hands.

The industry-standard tools are a locked room.

2 / 124

Of Serato's entire interface, a screen reader can read **two elements out of a hundred and twenty-four**. Access broke at v1.8 and was never restored.

“We never intentionally supported those programs.”

– SERATO PRODUCT PLANNER, ON THE RECORD

“If only 1 in 10,000 DJs need this, it makes it a lot harder to prioritise.”

– SERATO PRODUCT PLANNER

Virtual DJ's skinned dialogs “would break screen readers.”

– VIRTUAL DJ CTO · “NO TIMELINE” FOR A FIX

Don't make the **screen** readable. Get the **facts** out — and say them out loud.

01

Reads from the inside

Reads Serato's live internal state directly — deck, time, key, BPM, cues, effects, crates — and djay through the Mac's own accessibility system. Nothing guessed; if it can't read something, it says so.

02

Names the hardware

Plug in a controller and every knob, pad and fader announces what it does the moment you touch it — with zero setup. A blind DJ could never map by sight; AccessBridge ships that knowledge built in.

03

Speaks, and drives

One clean voice — it can even speak through the screen reader the DJ already trusts — and it drives the software back: load a track, set a cue, sort the library, jump a beat.

Opposite problems, one seamless experience.

SERATO DJ PRO — BUILT TO BE SEEN

Read from the inside

2 of 124 elements readable • no official way in

A small component rides safely **within Serato** and reads its real, live objects directly — read-only, with **no screen capture and no fake clicks**. Serato even names controls standalone, from AccessBridge's own IP-clean profiles.

DJAY PRO — ALREADY ACCESSIBLE

Name the hands

Won a 2016 Apple Design Award for accessibility

djay already publishes its decks, times and library to the Mac's accessibility system — so AccessBridge doesn't re-read it. It does the one thing djay can't: **name the controller** under the DJ's hands.

SHIPPED - NOT A PROMISE

What works **today.**

- **Reads all four decks** — track, artist, BPM, key, time left, and the live pitched tempo.
- **Speaks effects, loops, beat-jumps, hot cues** — and the whole library and crate system.
- **Speaks the moment a control moves** — no lag, at the pace of the wheel.
- **Names any supported controller on touch** — in both Serato and djay, with no setup.
- **Drives Serato** — loads tracks (incl. streaming), sorts, searches, files & removes, works the online catalogue.
- **Quiet menu-bar app, full keyboard console** — in testers' hands now.

Not something a competitor clones in a weekend.

~30K

lines of Swift / C++, built and rebuilt

470+

automated tests — every claim proven on real hardware

0

official APIs — no door was left open on purpose

100%

original, IP-clean controller data — lifted from no one

Months of reverse-engineering: reading Serato's private state without disturbing the app or the music, wall after wall climbed or honestly ruled out. **That hard-won knowledge, done reliably and honestly, is the real moat** — and it is largely done.

Overdue, and right on time.

2.2B

vision-impaired people worldwide (WHO); tens of millions are blind.

2025

EU Accessibility Act takes effect — accessibility becomes law, not goodwill; ADA enforcement keeps expanding.

Built for the blind — better for everyone.

Captions, voice control and screen readers all began as “for a few” and became “for everyone.” The same engine that names a controller by ear is a powerful hands-free layer for any DJ. The wedge: the default accessibility layer for the two dominant platforms — with a natural path to licensing the vendors themselves.

Credibility no engineering team can buy.

DJ Breezy Wonder

PRODUCER • ENGINEER • DRUMMER • LIVE-SOUND • DJ

A blind producer, mix & mastering engineer, and DJ — with production credits alongside artists the culture knows.

He didn't commission this from a lab. He built the thing he needed, because he is exactly the DJ it's for.

The person who feels every missing detail is the person designing it.

Not an invoice — a **value exchange.**

LOWEST FRICTION

Consulting / integration

Fund building this into the product — the most common, easiest place to start.

ENDORSE & BUNDLE

Technology license

Bundle or endorse it; the DJ keeps serving the community that champions it.

ALL THE WAY

License or acquisition

Exclusive license or acquisition — including the developer who understands it.

STRONGEST
OPENING

A paid pilot with a live demo — a blind DJ running your flagship, on stage-standard hardware, with zero setup. See it once and the case makes itself.

Three places it moves the needle.

01

Windows

The core is already ported and green; a large share of DJs are on Windows. Funding finishes and ships it — reaching the blind DJs Serato left behind.

02

Every controller, out of the box

Extend beyond MIDI to the HID / Pro-DJ-Link CDJ & XDJ media players that run in club booths, so “zero setup” holds on any rig a blind DJ walks up to.

03

Distribution & support

Onboarding built for a blind first-run, documentation, and a real support channel — download to first set, no sighted help.

From me, to the world.

Serato DJ Pro & djay Pro, playable by ear.
